### Investigation (Real-Life Inquiry)

Choose any three items from your home (for example: a bicycle, mobile phone, television, fan, mixer, chair, watch, school bag, or book). Ask a parent or guardian the following questions:

- Approximately how much was the item bought for? (Cost Price)
- If the item were sold today, approximately how much could it be sold for? (Estimated Selling Price)

Complete the table below.

| Item | Approximate Cost Price (₹) | Estimated Selling Price Today (₹) | Profit or Loss? | Explain Why |
|------|----------------------------|-----------------------------------|-----------------|-------------|
| a)   |                            |                                   |                 |             |
| b)   |                            |                                   |                 |             |
| c)   |                            |                                   |                 |             |

### Higher-Order Thinking (HOTS)

Answer the following questions.

1. Why do some products become more valuable over time while others become less valuable?
2. Can a shopkeeper sell an item at a lower price than it was bought for and still benefit? Explain with an example.
3. If two shopkeepers earn ₹100 profit, does it mean both businesses performed equally well? Explain your thinking.
4. A customer always wants the lowest price, while a shopkeeper wants to make a profit. How can both be satisfied?
5. If you were starting your own small business, what factors would you consider before deciding the selling price of your product?
6. Imagine you buy a cricket bat for ₹1,500. After one year, would you expect to sell it for more or less than ₹1,500? Explain the reasons behind your answer.
